Ms. Faust:

NewEnergy Associates & Ventyx

NewEnergy Associates has offered software products and consulting services which encompass planning, forecasting, operations, trading, and risk management for the energy industry. Headquartered in Atlanta, Georgia, NewEnergy has specialized in the development and support of integrated business applications for more than 32 years.

On August 31, 2007 NewEnergy was acquired by Ventyx. The combined company, with more than 1000 employees and 700 clients worldwide, serves electric and natural gas utilities, marketers and traders, energy retailers, power generators, and transmission companies, as well as state and federal governments.

SENDOUT

SENDOUT is the standard in gas planning software, and is accepted as such by many regulatory bodies in North America. It has been continually developed and updated over the past 22 years. It is currently used on behalf of more than 100 gas utilities, gas marketers, electric generators, and capacity managers in the USA and Canada.

Gas Planning Software Market

SENDOUT's largest competitor is the homegrown system based on Excel spreadsheets. There are few other competitors in North America for SENDOUT, which enjoys a dominant share of the gas planning software market. There are very few gas utilities of any substantial size that do not use SENDOUT.

By any measure, SENDOUT is the most reliable tool for the natural gas supply planning process. It should remain as such for the foreseeable future, as upgrades are not only being made right now, but the planned future improvements should keep SENDOUT ahead of the game for many years.

Questar & SENDOUT

Questar is committed to the gas supply planning process and has been for a number of years. Questar has been a SENDOUT client since 1992. As an active SENDOUT client, Questar receives version upgrades regularly, as well as training and consulting services from NewEnergy.

Questar is using the latest version of SENDOUT - Version 12.1.1 - which includes the latest in Monte Carlo analysis. On January 14-16, 2008 several people at Questar

received three days of training in the proper use of SENDOUT, including the Monte Carlo functionality.

During this training session we used Questar's latest data. Using a client's own data in training allows users to be more comfortable during the learning process. It also provides an opportunity for NewEnergy to evaluate the general condition of the data, as well as answer any questions that users may have regarding proper modeling techniques.

Constraints in SENDOUT

Constraints are an integral and necessary part of the Linear Programming (LP) method. The function of the LP in SENDOUT is to find the minimum cost decision based on given requirements and limitations. Constraints are limits on different aspects of the physical movement of gas, facilities and contracts. For example, a constraint would be the maximum capacity of a storage reservoir. In that sense the constraint cannot be removed because a reservoir of infinite size does not exist. In the same sense transportation capacity is a constraint. Without constraints the LP fails to return a solution let alone an optimal solution. Constraints don't need to be thought of as negative -- rather they are necessary to optimize a real world problem.

In SENDOUT it is possible to include an excessive number of constraints in the model. I have seen this on several occasions and have attempted to guide those users away from this course of action. During this three day training session I had ample opportunity to evaluate Questar's data. It is my opinion that Questar was using SENDOUT reasonably, and I saw no evidence that the Questar model was unduly constrained.

Questar's SENDOUT Model

Questar's system is one of the more complex systems currently being modeled in SENDOUT. Company owned production is a relatively unusual item in the SENDOUT world. Only a few companies model any company production at all, let alone the very large volume that Questar models. The 21 year time horizon also adds to the model's complexity. Only a handful of SENDOUT models go beyond ten years.

I hope this letter summarizes the information that you need. Please let me know if you need anything additional.

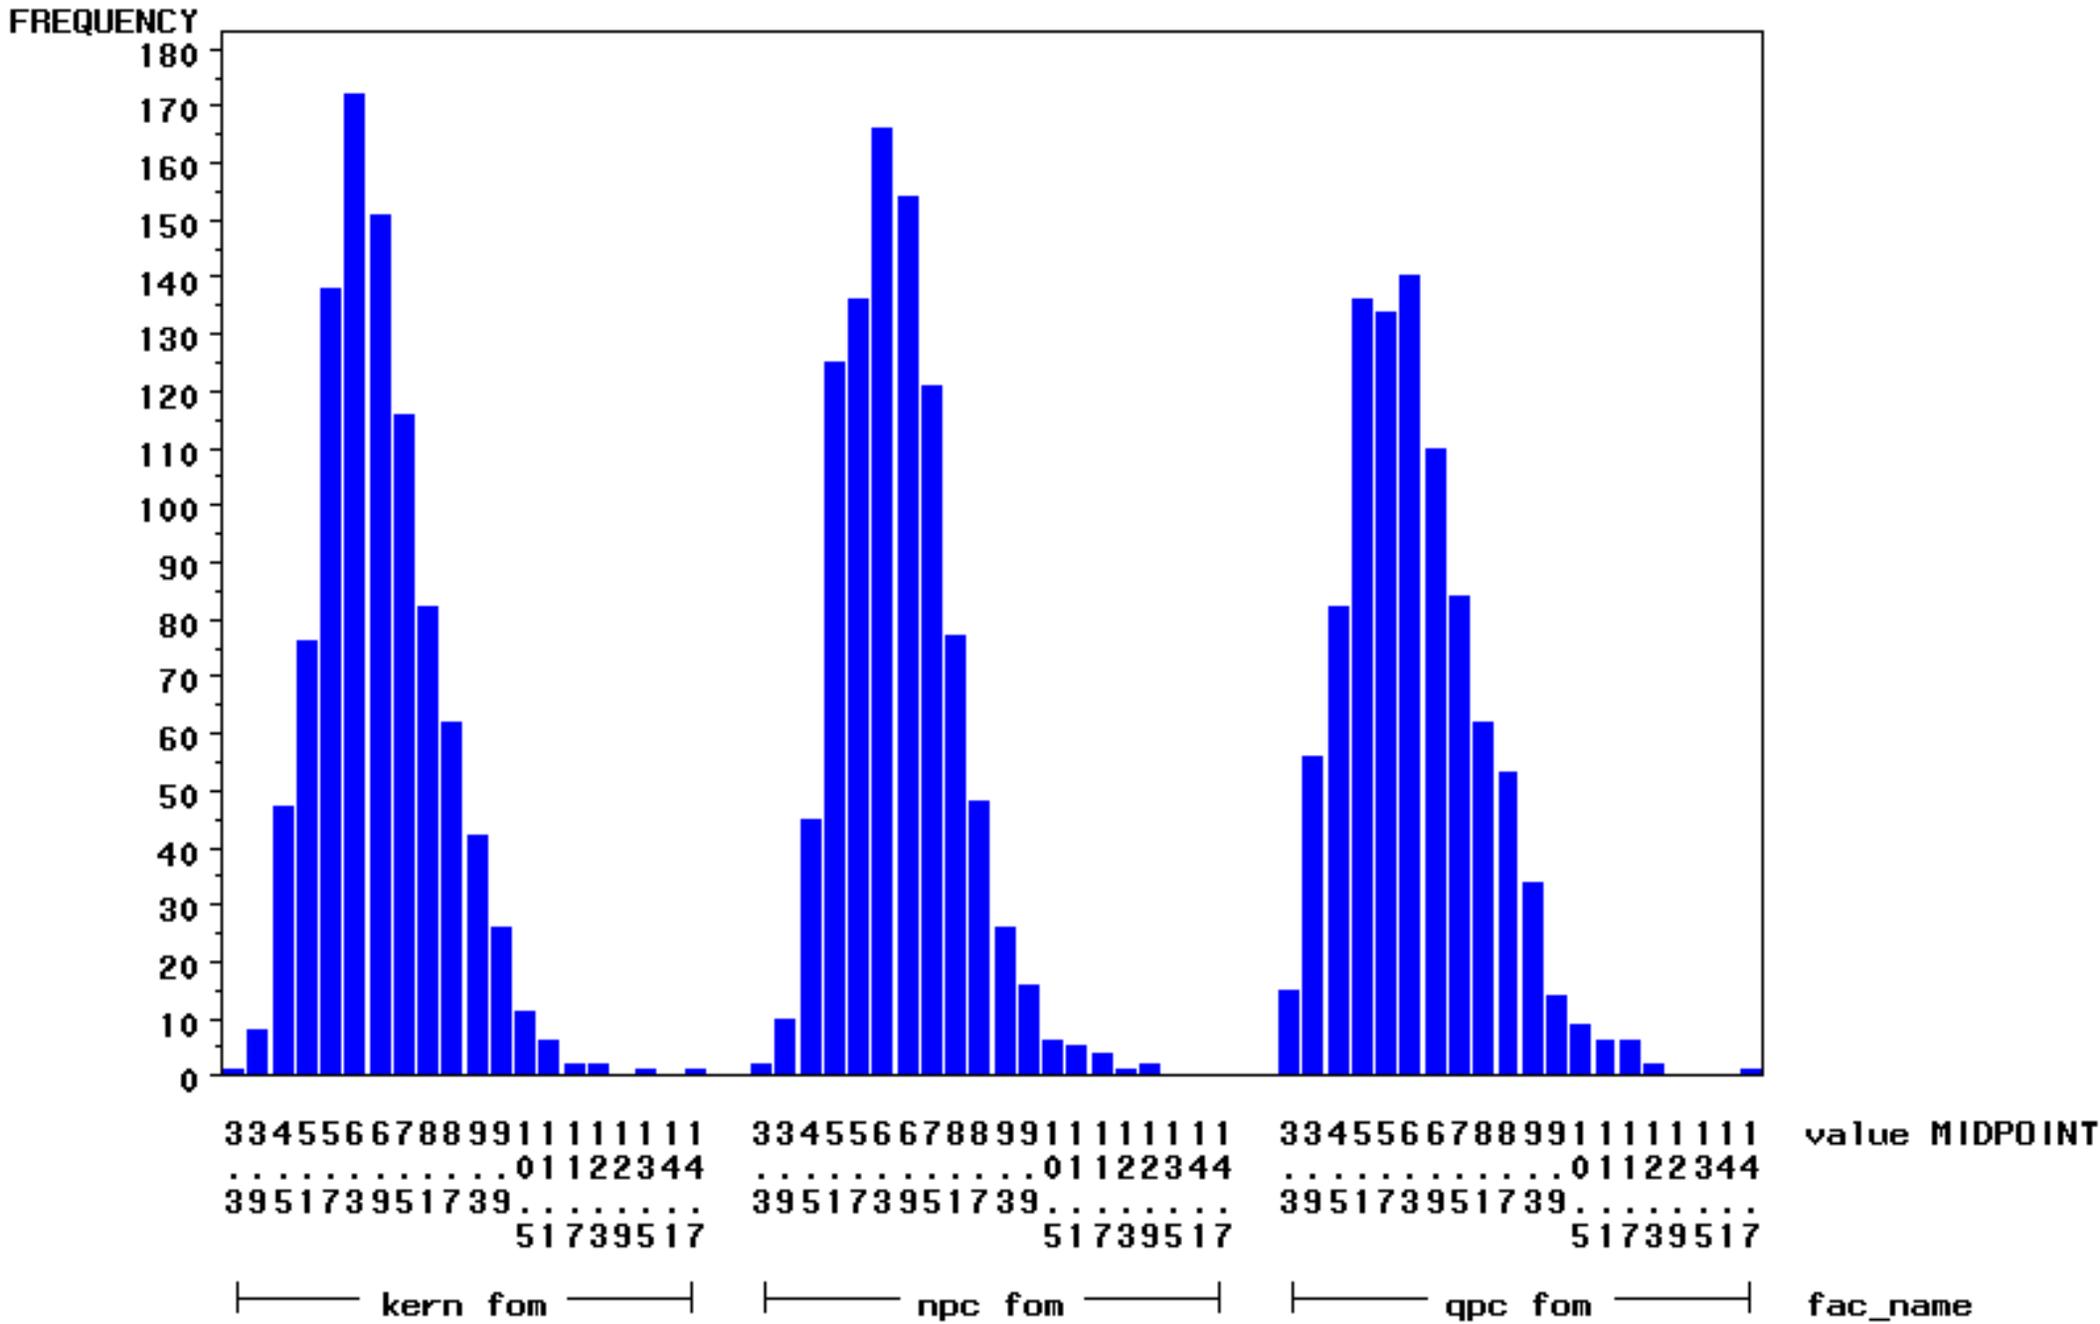

Regards,

Jeff Baker
